# 1 Progress

The following items are listed in the order of priority:

- DLO Dataset (RAL): Last week, I moved DLO data collection parts to UTARI and set up the test rig. Today, I collected multiple DLO manipulation test episodes. This week, I will work on DLO data extraction and the method section of the paper.

- Maicol:

- DLO Manipulation (IROS): [1].

- XEst (RAL —): No update.

# 2 Research Plan

This section outlines my current research plan for the next 3 months, 6 months, and 1 year. Moreover, I have included open projects and ideas to keep track of them.
Target conferences: ICRA, IROS (March), CASE (Late Feb.), NIPS.
Target Journals: RAL, CVPR, CORAL.

## 2.1 Research Plan:

- **3 months:** The primary objective will be to publish the DLO dataset paper, (DLO-1), finished my classes, and to meet my next Ph.D. milestone, the comprehensive exam. My goal is to submit the DLO dataset paper to IROS by March 1st.

- **6 months:** Next, I want to explore using DMD as a method to retrieve the correct Quaternion solution for the QuEst method, (QuEst-01). I believe this testing this is fairly fast and I should be able to publish that paper fairly quickly. I believe the RAL would be an appropriate journal to target; we can discuss this further with Dr. Gans to get his input.

- **1 year:** Next, I want to focus on (PIKO-01) as a method for fast online system identification. My aim is to confirm this method by comparing it against existing Koopman-based methods. In the following work, I will extend this method to control DLOs in real time (DLO-02).

### 2.2 Research Pipeline:

- DLO-01 (IROS - March 1st, 2023): DLO manipulation dataset with DLO configuration and gripper pose, as well as the gripper control input. Ideally, UR5 back-EMF current and bus voltage should be recorded. A DLO mount is introduced. A method for configuration estimation is introduced. Perhaps, a method for learning DLO dynamic can be trained and introduced.

- QuEst-01 (IROS): Optimal transform solution for QuEst based on dominant mode decomposition (DMD).

- PIKO-01 (TBD): This work leverages DMD and Physics-Informed machine learning to extract low-dimensional coherent modal structures from dynamic data. This method will extend DMD-based approaches to include mixed basis functions. Moreover, this method will automatically try to find the best fit at a specified range of ranks. This method will be validated by comparing it against the existing Koopman-based MPC control schemes for VTOL-DIP method and introducing a method for controlling VTOL-TIP in simulation. This method will become the backbone of my Koopman-based MPC control research effort.

- DLO-02 (TBD): This method will extend PIKO-01 to a control method for the DLO-01 dataset.
